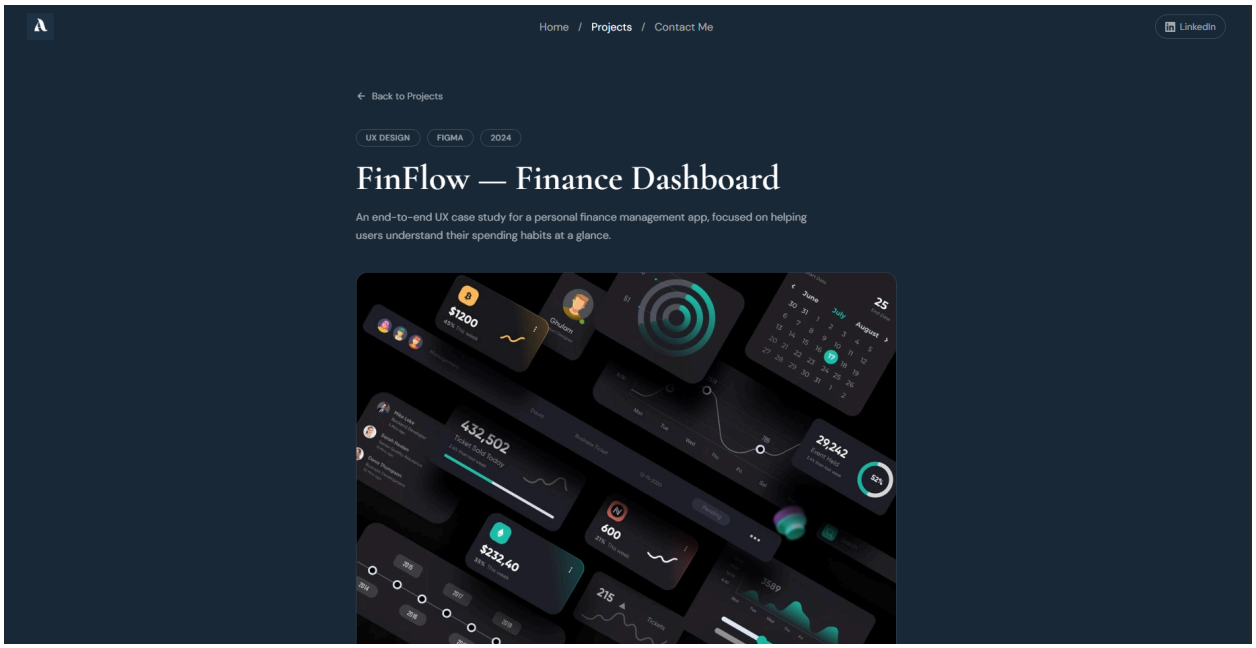
Portfolio Website Development

In this final stage of the project, I made some changes to the website based on the feedback I received from the previous assessment, as well as the usability testing.

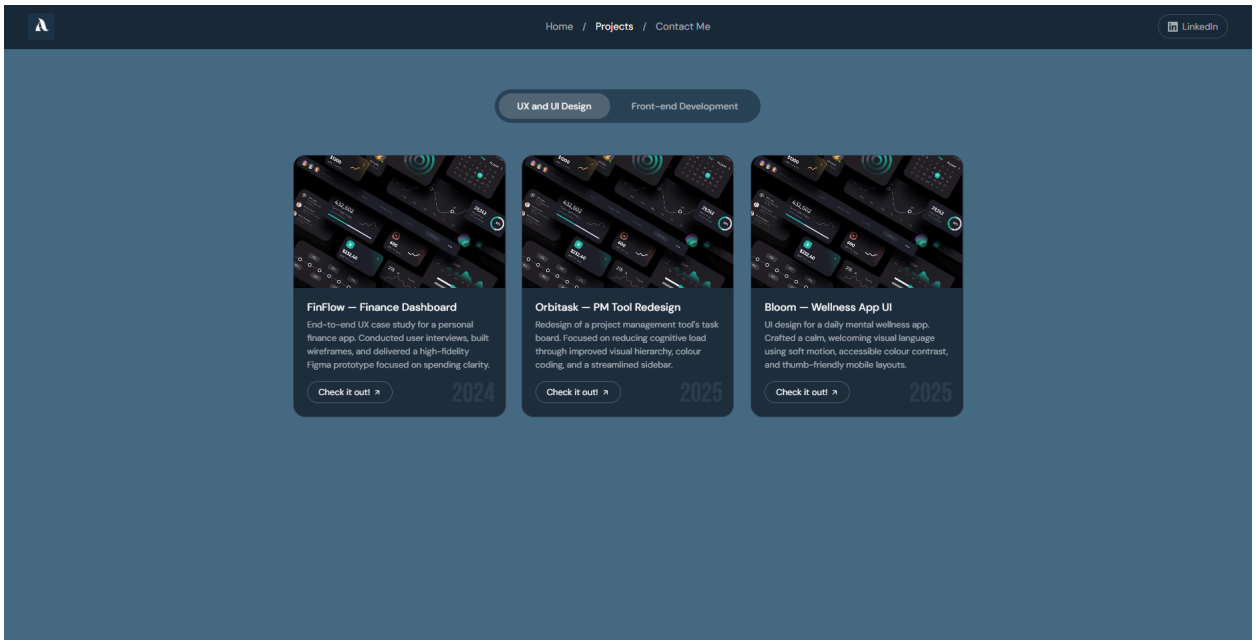
The projects section of the website was underdeveloped. Even if this is just a “mock” or fictional portfolio site, it’s a portfolio site nonetheless, and properly showcasing the developer’s work should be a top priority. Now, the projects aren’t simply listed in the Projects section and presented in card format, and the” check it out” buttons take you to a detailed page where the user can find out more about each project, showing the developer’s expertise and process.

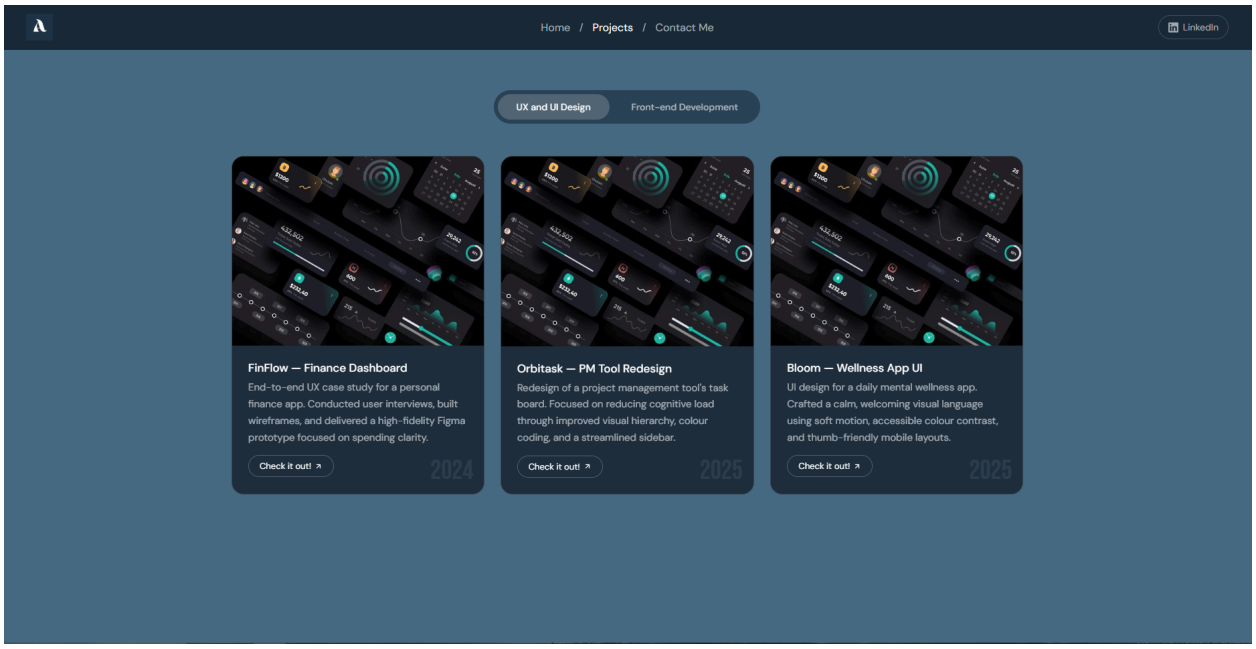


When testing the website, users were able to navigate the website intuitively and without issue, and found all the sections straightforward and easy to understand. Some things that they noted that could be improved though, were the cards of the project section, which appeared a bit small. This wasn’t intentional and they could definitely use more space, so I increased the size of their containers, and now the section has a more natural look.

I also slightly increased the font size throughout the page, as some users suggested it could slightly improve readability.

Assessment 3 COMP 2002 - Rodrigo González





Overall I'm satisfied with the final product. It's the first time I completed a web development project end-to-end, and I have learned a lot. It has given me a solid foundation of "vanilla" web development, and given me the confidence to jump into some frameworks to tackle more complex projects. I also now have a cool portfolio website template I can use or share with a friend who needs one.
